## Rail-to-Rail Amplifier

### AMP\_RR01 XB06

#### General Description

The rail-to-rail amplifier AMP\_RR01 standard cell is a versatile operational amplifier mostly intended to be used as voltage buffer (follower, gain=1). Its primary purpose is to drive extremely large capacitive loads (up to 150pF). For example it can be used for reference voltage distribution or other stimulation purposes in the lower frequency range. It is designed for low output offset voltage and fast settling behaviour.
