

General Description

The CSMC Macro Standard Cell is essential element for high frequency stimulated, capacitive sensor based sensor or data acquisition systems. It's main purpose is the measure capacitances in the Femtofarad range at convert the result into the digital domain. The Input and Output ports are defined in a way, that systems with 1 to 100 inputs are feasible. Digital control and sensor stimulus generation are not included in the cell and have to be added to give a complete data acquisition system.
